

# Introduction to CSS and Styling Basics

## Theory Assignments ::

### **1.Explain the difference between inline, internal, and external CSS**

Answer: Inline CSS is applied directly to an HTML element using the style attribute; internal CSS is defined within a <style> tag in the <head> section of an HTML document; and external CSS is defined in a separate .css file and linked to the HTML document using a <link> tag.

### **2. Describe CSS selectors and list the types of selectors (e.g., element, class, id)**

Answer: CSS selectors are patterns used to select the HTML elements that are to be styled.

Element selector: Selects elements based on their tag name (e.g., p selects all paragraph elements).

Class selector: Selects elements with a specific class attribute, indicated by a period (.) followed by the class name (e.g., .myClass).

ID selector: Selects a unique element with a specific id attribute, indicated by a hash symbol (#) followed by the ID name (e.g., #myID).

Universal selector: Selects all elements on the page using an asterisk (\*).

Attribute selector: Selects elements with a specific attribute or attribute value (e.g., [type="text"]).

### **3. Discuss the CSS box model and its components**

Answer: The CSS box model is a box that wraps around every HTML element, and it consists of content, padding, border, and margin.

Content: The actual content of the element, such as text or images.

Padding: The space between the content and the border.

Border: A line that goes around the padding and content.

Margin: The space outside the border, separating the element from other elements.
